

FARM MANAGEMENT SYSTEM

7. PROJECT DOCUMENTATION

7.1 Documentation Overview

The project documentation describes the development of the Farm Management System, including its objectives, requirements, system design, implementation, testing, advantages, limitations and future enhancements.

7.2 Documentation Contents

- Project Overview
- Purpose and Objectives
- Problem Statement
- Functional and Non-Functional Requirements
- System Architecture
- Farm and Crop Management Process
- Development Walkthrough
- Testing Details
- Advantages and Disadvantages
- System Limitations
- Future Scope
- Appendix

7.3 Project Purpose

The purpose of the Farm Management System is to provide a centralized platform for managing farm-related information. It helps maintain farmer details, farm records, crop information, farming activities and buyer details in an organized manner. The system reduces manual record keeping and makes farm information easier to access, update and manage.

7.4 Advantages

- Centralized management of farm and agricultural data.
- Reduces paperwork and manual record maintenance.
- Improves the organization and accuracy of farm records.

- Provides reports and dashboards for better visibility of farm information.
- Allows role-based access to farm management information.
- Provides cloud-based access for authorized users.

7.5 Disadvantages and Constraints

- Requires reliable internet connectivity for cloud-based access.
- Depends on the Salesforce platform and applicable licensing.
- Offline functionality is limited.
- Users need appropriate permissions and basic knowledge of the system.
- The system may have limitations when handling farm activities without proper data entry.

7.6 Future Scope

- Mobile application integration for farmers and field users.
- AI-based crop prediction and farming recommendations.
- IoT sensor integration for monitoring farm conditions.
- Weather-data integration for better farm planning.
- Market-price forecasting to support agricultural decisions.
- Advanced analytics and intelligent alerts for farm management.

7.7 Documentation Deliverables

- Requirement documentation for the Farm Management System.
- System design and architecture documentation.
- Development and configuration details.
- Testing documentation.
- User demonstration procedure.
- Future enhancement plan.

7.8 Conclusion

The Farm Management System provides an organized and efficient way to manage farm-related information. It helps maintain farmer, farm, crop and agricultural activity records in a centralized system. The project

documentation covers the requirements, design, development and testing of the system and provides a foundation for future improvements and additional farming features.
